Table 1: BLUE of the combination ( $\chi^2/\text{ndof} = 2.46/6$ ). For each input measurement  $i$  the following are listed: the central value weight  $\text{CVW}_i$  or  $\lambda_i$ , the intrinsic information weight  $\text{IIW}_i$ , the marginal information weight  $\text{MIW}_i$ , the relative importance  $\text{RI}_i$ . The intrinsic information weight  $\text{IIW}_{\text{corr}}$  of correlations is also shown on a separate row.

*WARNING! This is an example where inputs are taken from Table 4 in CMS PAS TOP-12-001. The output results differ because of rounding errors in those inputs.*

Table 2: Normalised Fisher information derivatives  $1/I \cdot dI/dX$  for the combination under consideration. The derivatives in the table are computed with respect to scale factors  $X$ , representing the ratio of a given correlation to its "current" value in the combination under consideration, and all normalized by the information  $I$  for the "current" values of correlations. They are computed for the "current" values of correlations (in this case: nominal correlations). Color boxes indicate normalised derivatives greater than 0.05 (yellow), 0.10 (orange) and 0.15 (red). The last column and last row list information derivatives when the same rescaling factor is used for a given off-diagonal element or error source, which are equal to the sums of individual derivatives in each row and column, respectively.

	ALJ10	ALJ11	AJT11	CLL10	CLJ10	CLL11	CMJ11

Table 23: BLUE of the combination ( $\chi^2/\text{ndof} = 2.10/6$ ). For each input measurement  $i$  the following are listed: the central value weight  $\text{CVW}_i$  or  $\lambda_i$ , the intrinsic information weight  $\text{IIW}_i$ , the marginal information weight  $\text{MIW}_i$ , the relative importance  $\text{RI}_i$ . The intrinsic information weight  $\text{IIW}_{\text{corr}}$  of correlations is also shown on a separate row.

Parameter name	ParID	Parameter value ScaleFactor X @MIN	1/I <sup>nom</sup> *dI/dX			Fixed or Variable
			@0	@MIN	@1	
GlobalScaleFact	#0	0.8746 ± 0.8162	-2.9074	~ 0	0.2204	Variable

Table 24: Normalised Fisher information derivatives  $1/I^{\text{nom}}*dI/dX$  (before and after minimization) and minimization results. The derivatives in the table are computed with respect to scale factors X, representing the ratio of a given correlation to the corresponding nominal correlation, and all normalized by the information  $I^{\text{nom}}$  at nominal correlations ("@1"). They are computed at three different values of the scale factors X: for nominal values of all correlations (i.e. when all scale factors are 1: "@1"), for correlations all equal to zero (i.e. when all scale factors are 0: "@0") and for the scale factors minimizing Fisher information ("@MIN"). In the minimization, the scale factors X are varied (between 0 and 1, starting at 1) if  $1/I^{\text{nom}}*dI/dX@1 > 0.001$  and  $dI/dX@0 < 0$ .

*WARNING! This is an example where inputs are taken from Table 4 in CMS PAS TOP-12-001. The output results differ because of rounding errors in those inputs.*

Table 25: Normalised Fisher information derivatives  $1/I \cdot dI/dX$  for the combination under consideration. The derivatives in the table are computed with respect to scale factors  $X$ , representing the ratio of a given correlation to its "current" value in the combination under consideration, and all normalized by the information  $I$  for the "current" values of correlations. They are computed for the "current" values of correlations (in this case: correlations in minimization by global factor). Color boxes indicate normalised derivatives greater than 0.05 (yellow), 0.10 (orange) and 0.15 (red). The last column and last row list information derivatives when the same rescaling factor is used for a given off-diagonal element or error source, which are equal to the sums of individual derivatives in each row and column, respectively.

	ALJ10	ALJ11	AJT11	CLL10	CLJ10	CLL11	CMJ11

Table 45: BLUE of the combination ( $\chi^2/\text{ndof} = 1.96/6$ ). For each input measurement  $i$  the following are listed: the central value weight  $\text{CVW}_i$  or  $\lambda_i$ , the intrinsic information weight  $\text{IIW}_i$ , the marginal information weight  $\text{MIW}_i$ , the relative importance  $\text{RI}_i$ . The intrinsic information weight  $\text{IIW}_{\text{corr}}$  of correlations is also shown on a separate row.

Table 46: Normalised Fisher information derivatives  $1/I^{\text{nom}}*dI/dX$ (before and after minimization) and minimization results. The derivatives in the table are computed with respect to scale factors X, representing the ratio of a given correlation to the corresponding nominal correlation, and all normalized by the information  $I^{\text{nom}}$  at nominal correlations ("@1"). They are computed at three different values of the scale factors X: for nominal values of all correlations (i.e. when all scale factors are 1: "@1"), for correlations all equal to zero (i.e. when all scale factors are 0: "@0") and for the scale factors minimizing Fisher information ("@MIN"). In the minimization, the scale factors X are varied (between 0 and 1, starting at 1) if  $1/I^{\text{nom}}*dI/dX@1 > 0.001$  and  $dI/dX@0 < 0$ .

*WARNING! This is an example where inputs are taken from Table 4 in CMS PAS TOP-12-001. The output results differ because of rounding errors in those inputs.*

Table 47: Normalised Fisher information derivatives  $1/I \cdot dI/dX$  for the combination under consideration. The derivatives in the table are computed with respect to scale factors  $X$ , representing the ratio of a given correlation to its "current" value in the combination under consideration, and all normalized by the information  $I$  for the "current" values of correlations. They are computed for the "current" values of correlations (in this case: correlations in minimization by error source). Color boxes indicate normalised derivatives greater than 0.05 (yellow), 0.10 (orange) and 0.15 (red). The last column and last row list information derivatives when the same rescaling factor is used for a given off-diagonal element or error source, which are equal to the sums of individual derivatives in each row and column, respectively.

Table 68: Normalised Fisher information derivatives  $1/I^{\text{nom}}*dI/dX$ (before and after minimization) and minimization results. The derivatives in the table are computed with respect to scale factors X, representing the ratio of a given correlation to the corresponding nominal correlation, and all normalized by the information  $I^{\text{nom}}$  at nominal correlations ("@1"). They are computed at three different values of the scale factors X: for nominal values of all correlations (i.e. when all scale factors are 1: "@1"), for correlations all equal to zero (i.e. when all scale factors are 0: "@0") and for the scale factors minimizing Fisher information ("@MIN"). In the minimization, the scale factors X are varied (between 0 and 1, starting at 1) if  $1/I^{\text{nom}}*dI/dX@1 > 0.001$  and  $dI/dX@0 < 0$ .

*WARNING! This is an example where inputs are taken from Table 4 in CMS PAS TOP-12-001. The output results differ because of rounding errors in those inputs.*

Table 69: Normalised Fisher information derivatives  $1/I \cdot dI/dX$  for the combination under consideration. The derivatives in the table are computed with respect to scale factors  $X$ , representing the ratio of a given correlation to its "current" value in the combination under consideration, and all normalized by the information  $I$  for the "current" values of correlations. They are computed for the "current" values of correlations (in this case: correlations in minimization by off-diagonal elements). Color boxes indicate normalised derivatives greater than 0.05 (yellow), 0.10 (orange) and 0.15 (red). The last column and last row list information derivatives when the same rescaling factor is used for a given off-diagonal element or error source, which are equal to the sums of individual derivatives in each row and column, respectively.

	ALJ10	ALJ11	AJT11	CLL10	CLJ10	CLL11	CMJ11

Table 89: BLUE of the combination ( $\chi^2/\text{ndof}=0.64/1$ ). For each input measurement  $i$  the following are listed: the central value weight  $\text{CVW}_i$  or  $\lambda_i$ , the intrinsic information weight  $\text{IIW}_i$ , the marginal information weight  $\text{MIW}_i$ , the relative importance  $\text{RI}_i$ . The intrinsic information weight  $\text{IIW}_{\text{corr}}$  of correlations is also shown on a separate row.

Table 90: From the original combination of 7 with nominal correlations, a new combination where all remaining 2 measurements have central value weights  $\text{CVW}>0$  was derived by removing measurements iteratively. At each step of the iteration, the measurement with the most negative  $\text{CVW}\leq 0$  in the combination with  $N$  measurements was removed until all remaining measurements had  $\text{CVW}>0$  in the combination of  $N-1$  measurements. For each iteration and for the final result, the results of the BLUE and the name, CVW and MIW of the measurement removed in that iteration are displayed.

Table 91: Normalised Fisher information derivatives  $1/I \cdot dI/dX$  for the combination under consideration. The derivatives in the table are computed with respect to scale factors  $X$ , representing the ratio of a given correlation to its "current" value in the combination under consideration, and all normalized by the information  $I$  for the "current" values of correlations. They are computed for the "current" values of correlations (in this case: correlations in combination with  $\text{CVW}>0$  measurements). Color boxes indicate normalised derivatives greater than 0.05 (yellow), 0.10 (orange) and 0.15 (red). The last column and last row list information derivatives when the same rescaling factor is used for a given off-diagonal element or error source, which are equal to the sums of individual derivatives in each row and column, respectively.

*WARNING! This is an example where inputs are taken from Table 4 in CMS PAS TOP-12-001. The output results differ because of rounding errors in those inputs.*

Table 132: BLUE of the combination ( $\chi^2/\text{ndof}=1.09/6$ ). For each input measurement  $i$  the following are listed: the central value weight  $\text{CVW}_i$  or  $\lambda_i$ , the intrinsic information weight  $\text{IIW}_i$ , the marginal information weight  $\text{MIW}_i$ , the relative importance  $\text{RI}_i$ . The intrinsic information weight  $\text{IIW}_{\text{corr}}$  of correlations is also shown on a separate row.

*WARNING! This is an example where inputs are taken from Table 4 in CMS PAS TOP-12-001. The output results differ because of rounding errors in those inputs.*

Table 133: Normalised Fisher information derivatives  $1/I \cdot dI/dX$  for the combination under consideration. The derivatives in the table are computed with respect to scale factors  $X$ , representing the ratio of a given correlation to its "current" value in the combination under consideration, and all normalized by the information  $I$  for the "current" values of correlations. They are computed for the "current" values of correlations (in this case: zero correlations). Color boxes indicate normalised derivatives greater than 0.05 (yellow), 0.10 (orange) and 0.15 (red). The last column and last row list information derivatives when the same rescaling factor is used for a given off-diagonal element or error source, which are equal to the sums of individual derivatives in each row and column, respectively.

## Appendix A1. Input data.

```

1 #=====
2 #=== BlueFin input data file =====
3 #=====
4
5 # The file is expected to have the following format.
6 # Blank lines and lines with only empty spaces are ignored.
7 # Lines starting by '#' are reserved for comments and are ignored.
8 # Data lines are composed of fields separated by one or more empty spaces.
9 # Fields cannot contain empty spaces, with the exception of the title line.
10
11 # The next line must have 2 fields: 'TITLE' and the title of the
12 # BlueFin combination, which must be enclosed within double quotes
13 # and may contain only alphanumeric characters or spaces or hyphens.
14 TITLE "LHC top mass combination 2012"
15
16 # The next line must have 2 fields: 'NOBS' and the number of observables.
17 NOBS 1
18
19 # The next line must have 2 fields: 'NMEA' and the number of measurements.
20 NMEA 7
21
22 # The next line must have 2 fields: 'NERR' and the number of error sources.
23 NERR 18
24
25 # The next NERR+3 lines must have NMEA+1 fields in this format:
26 # - in the 1st line: 'MEANAME' followed by NMEA distinct measurement names
27 #   (measurement names may contain only alphanumeric characters or spaces);
28 # - in the 2nd line: 'OBSNAME' followed by the NMEA names (with NOBS distinct
29 #   values) of the observables measured by the corresponding measurements
30 #   (observable names may contain only alphanumeric characters or spaces
31 #   and should preferably be at most 3 characters long);
32 # - in the 3rd line: 'MEVAL' followed by the NMEA measured central values;
33 # - in each of the last NERR lines: the error source name followed by the
34 #   NMEA partial errors for each measurement due to the given error source
35 #   (error source names may contain only alphanumeric characters or spaces).
36 MEANAME      ALJ10      ALJ11      AJT11      CLL10      CLJ10      CLL11      CMJ11
